

Geodesy Exercises

MARCO PIRAS

Ellipsoid parameters

$$\alpha = \frac{a - c}{a}$$

$$e'^2 = \frac{a^2 - c^2}{c^2}$$

$$e^2 = \frac{a^2 - c^2}{a^2}$$

$$e'^2 = \frac{e^2}{1 - e^2}$$

$$c^2 = a^2(1 - e^2)$$

BESSEL (1841)

CLARKE (1880)

HAYFORD (1909)

WGS84 (1984)

$a = 6.377.397$ m

$a = 6.378.243$ m

$a = \mathbf{6.378.388}$ m

$a = 6.378.137$ m

$\alpha = 1/299,2$

$\alpha = 1/293,5$

$\alpha = \mathbf{1/297,0}$

$\alpha = 1/298,257223563$

Ex.1 Ellipsoid's parameters

ELLISSOIDE	a [m]	α	$c = a(1 - \alpha)$	e^2	e'^2
Delambre	6.376.985	1/308.6			
Everest	6.377.276	1/300.8			
Bessel	6.377.397	1/299.1528128			
Fisher	6.378.338	1/288.5			
Clarke	6.378.249	1/293.5			
Helmert	6.378.140	1/298.3			
Hayford	6.378.388	1/297.0	6.356.911,9	0,0067226700	0,0067681702
Krassovsky	6.378.245	1/298.3			
WGS84	6.378.137	1/298.257223563			

To estimate the ellipsoid's parameters

Ex.2 coordinates transformation from (ϕ, λ, h) to (XYZ)

Parametric equation of the ellipsoid

$$\begin{cases} X = \left(\frac{a}{W} + h \right) \cos \varphi \cdot \cos \lambda \\ Y = \left(\frac{a}{W} + h \right) \cos \varphi \cdot \sin \lambda \\ Z = \left[\frac{a}{W} (1 - e^2) + h \right] \cdot \sin \varphi \end{cases}$$

where

$$W = \sqrt{1 - e^2 \cdot \sin^2 \varphi}$$

Ex.2 coordinates transformation from (ϕ, λ, h) to (XYZ)

points	Latitude (ϕ)	Longitude (λ)	h (m)
1	44° 45' 01",03930	7° 24' 29",20335	322,4909
2	44° 47' 10",90505	7° 30' 26",53939	305,7367

Considering the following ellipsoids:

- WGS 84
- Hayford

Try to change «h1», adding 2000 m. How is this value distributed in X, Y, Z?

Ex.3 coordinates transformation from (XYZ) to (ϕ, λ, h)

Longitude estimation $\lambda = \operatorname{arctg} \frac{Y}{X}$

Iterative procedure to estimate latitude and h

Step 1 $r = \sqrt{X^2 + Y^2}$ **And an approx latitude:** $\phi = \operatorname{arctg} \frac{Z}{r}$

Step 2 $W = \sqrt{1 - e^2 \cdot \sin^2 \phi}$ $N = \frac{a}{W}$

Step 3

$$h = \frac{X}{\cos \phi \cos \lambda} - N$$

$$\phi = \operatorname{arctg} \frac{Z}{r \left(1 - \frac{e^2 N}{N + h} \right)}$$

Threshold convergence = 10^{-8} (in h and latitude)

Ex.3 coordinates transformation from (XYZ) to (ϕ, λ, h)

Points	X [m]	Y [m]	Z [m]
1	4,499,525.4271	585,034.1293	4,467,910.3596
2	4,495,694.2695	592,457.8605	4,470,744.7781
3	4,503,484.7172	578,160.7507	4,465,024.3002
4	4,498,329.3715	562,840.7651	4,472,537.6125

Considering these following ellipsoids:

- WGS 84
- Hayford

Ex.4 – RS transformation

<http://www.epncb.oma.be/>

http://www.epncb.oma.be/_productservices/coord_trans/

The screenshot shows the EUREF Permanent Network website. The main heading is "EUREF PERMANENT NETWORK". Below it, there are several navigation tabs: ORGANISATION, NETWORK & DATA, PRODUCTS & SERVICES, DOCUMENTATION, and NEWS, EVENTS & LINKS. The "PRODUCTS & SERVICES" tab is selected, and the sub-tab "ETRF to ITRF TRANSFORMATION" is active. The page contains a form for transforming coordinates. The "Input" section has a "Frame" dropdown set to "ETRF89" and an "Epoch" dropdown set to "2000". Below this is a text area with instructions and examples. The "Output" section has a "Frame" dropdown set to "ITRF2000" and an "Epoch" dropdown set to "2000".

ETRF89 → ITRF89

ETRF2000 → ITRF2000

Using the XYZ of the EX. 2, to make these following transformations:

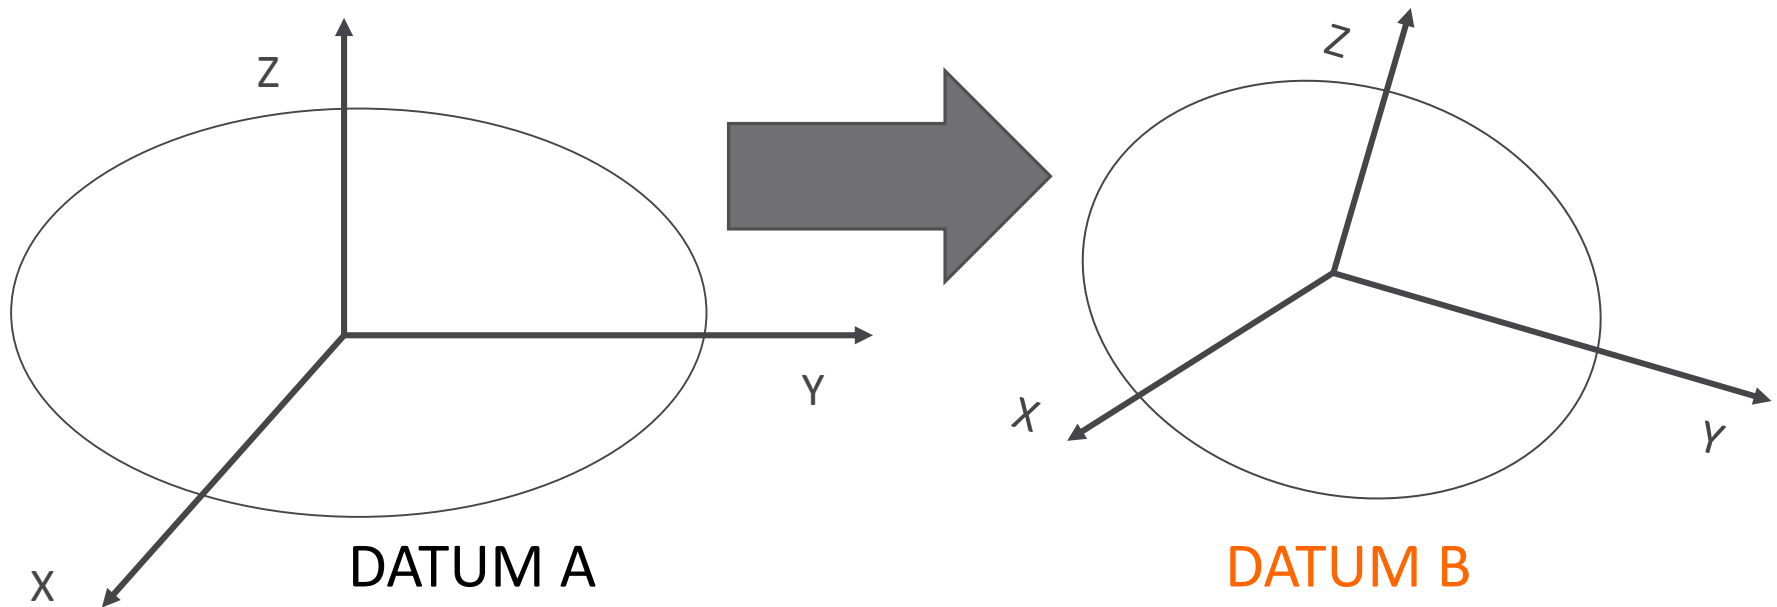

ETRF89 → ITRF89

ETRF2000 → ITRF2000

To analyze the differences.

Ex.5 – Helmert transformation

EX.5 – HELMERT TRANSFORMATION

$$\begin{pmatrix} X \\ Y \\ Z \end{pmatrix}_B = \begin{pmatrix} X_0 \\ Y_0 \\ Z_0 \end{pmatrix} + \lambda \begin{bmatrix} 1 & R_z & -R_y \\ -R_z & 1 & R_x \\ R_y & -R_x & 1 \end{bmatrix} \begin{pmatrix} X \\ Y \\ Z \end{pmatrix}_A$$

Ex.5 – Helmert transformation

Linearizing the equation around the approx. values:

$$\begin{bmatrix} X_B - X_A - T_X^{(o)} \\ Y_B - Y_A - T_Y^{(o)} \\ Z_B - Z_A - T_Z^{(o)} \end{bmatrix} = \begin{bmatrix} \Delta T_X \\ \Delta T_Y \\ \Delta T_Z \end{bmatrix} + \begin{bmatrix} \Delta\lambda & R_Z & -R_X \\ -R_Z & \Delta\lambda & R_X \\ R_Y & -R_X & \Delta\lambda \end{bmatrix} \begin{bmatrix} X_A \\ Y_A \\ Z_A \end{bmatrix}$$

Solving the system with the least squares::

$$\begin{bmatrix} 1 & 0 & 0 & X_A & 0 & -Z_A & Y_A \\ 0 & 1 & 0 & Y_A & -Z_A & 0 & -X_A \\ 0 & 0 & 1 & Z_A & Y_A & X_A & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \end{bmatrix} \cdot \begin{pmatrix} \Delta T_X \\ \Delta T_Y \\ \Delta\lambda \\ R_X \\ R_Y \\ R_Z \end{pmatrix} - \begin{bmatrix} X_B - X_A \\ Y_B - Y_A \\ Z_B - Z_A \\ \dots \end{bmatrix} = \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ \dots \end{pmatrix}$$

Ex.5 – Helmert transformation

$$\begin{bmatrix} 1 & 0 & 0 & X_A & 0 & -Z_A & Y_A \\ 0 & 1 & 0 & Y_A & -Z_A & 0 & -X_A \\ 0 & 0 & 1 & Z_A & Y_A & X_A & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \end{bmatrix} \cdot \begin{bmatrix} \Delta T_X \\ \Delta T_X \\ \Delta T_X \\ \Delta \lambda \\ R_X \\ R_Y \\ R_Z \end{bmatrix} - \begin{bmatrix} X_B - X_A \\ Y_B - Y_A \\ Z_B - Z_A \\ \dots \end{bmatrix} = \begin{bmatrix} v_1 \\ v_2 \\ v_3 \\ \dots \end{bmatrix}$$

A
X
l₀
Residuals

$$x = (A^T A)^{-1} (A^T l_0) \quad \text{Least squares solution}$$

*NB: In order to avoid singular matrix, it is better to divide the coordinates (X, Y, Z) by 10⁶.
At the end, It is necessary to multiply the translations by this value.*

Ex.5 – Helmert transformation

To estimate the HELMERT PARAMETER using the points reported in «points_helmert.txt».

- 1) Parameters estimation*
- 2) Analysis of the residuals*

Residuals (v)= $Ax - l_0$

- 3) Comments of the results*
